SEO AUDIT AND LOCAL SEARCH REPORT

Big Brother Guesthouse

A full technical and local search audit of bigbrotherguesthouse.com: how the site scores, what was repaired on 15 October 2026, and the short list of actions that will lift it further in Google and on the booking platforms.

Prepared by Tangison Studio

Usakos, Erongo Region, Namibia · 15 October 2026

1. Executive summary

This report answers three questions for Big Brother Guesthouse: how the new website at bigbrotherguesthouse.com is doing in search, what was repaired during the audit of 15 October 2026, and what should happen next. The short answer is that the site itself is in good shape. It loads quickly even on a weak mobile connection, every page carries proper titles and descriptions, and search engines are handed a clean sitemap, correct addresses and structured data describing the guesthouse, its rooms and the restaurant.

908 ms
Largest Contentful Paint, live measurement (Google target: under 2,500 ms)

0.00
Cumulative Layout Shift, live measurement (Google target: under 0.10)

106 KB
Total home page transfer on a phone-sized screen, site budget 500 KB

Most of the problems found during the audit were small, and every one of them was fixed the same day. The three that mattered most were duplicated brand text pushing page titles past Google's 60 character cut, missing social share tags on thirteen pages, and a footer link that pointed at a dead Namibia Tourism Board web address. All three repairs are already live on the production site, together with a corrected matangara photograph, a new section listing where to stay in and around Usakos when the guesthouse is full, and links to the guesthouse's verified listings on TripAdvisor, SafariNow and Google Maps.

What remains is work that only the owner can do, and none of it is technical. The single most valuable step is registering the free Google Search Console account and submitting the sitemap, because that is the only tool that shows exactly which searches bring guests to the site and which pages Google has not yet found. After that come two stale booking listings to freshen up, one broken website link in the restaurant's Google profile, and a handful of records and photographs the audit could not invent. Section 6 lists every item in order of value, with the effort each one takes.

2. What we checked and how the site scored

The audit covered all nineteen pages of the site plus the machinery behind them: how the pages respond, how they redirect, what the sitemap and robots files say, how each page is titled and described, whether the structured data renders, how the pages behave at a 390 pixel phone width, how much data each page spends, and whether every image carries a useful description. Off the site, the audit searched the major booking platforms and directories for the guesthouse's listings, checked how the two business names are used in public, and looked at the Google Business Profiles for both the guesthouse and the restaurant.

Area	What was checked	Verdict
Redirects and security	HTTP to HTTPS, www redirects, HSTS header, 404 page	Pass
Sitemap and robots	19 URLs listed on the correct www domain, robots points at the sitemap	Pass
Titles and descriptions	Unique per page, under 60 and 155 characters	Pass, after fix
Canonical addresses	Every page self-canonical, consistent www spelling	Pass
Structured data	LodgingBusiness, Restaurant and Menu schema render on the live pages	Pass, enriched
Mobile behaviour	390 px render: no horizontal scroll, one H1 per page	Pass
Speed and weight	Live lab vitals and transfer size against the 500 KB budget	Pass
Images	Alt text present, AVIF and WebP negotiation, lazy loading	Pass
Third-party listings	Presence and accuracy on booking platforms and directories	Mixed, see section 5
Google Search Console	Owner-side indexing tool	Not yet set up, see section 6

Table 1. Audit scorecard by area, checked 15 October 2026.

One technical note deserves a plain-language explanation. The site answers on two addresses, bigbrotherguesthouse.com and www.bigbrotherguesthouse.com, and the shorter one currently serves the pages directly instead of redirecting to the www version. Because every page carries a canonical tag pointing at the www version and the sitemap only lists www addresses, search engines will settle on the www version on their own. It is a small inefficiency rather than an error, and it can be tightened in the Vercel domain settings by redirecting the short address to the www one.

3. What was found and fixed on 15 October

Every finding below was reproduced, fixed in the code, checked on a local production build, then published and re-verified on the live site the same day. Nothing on this list is waiting on a third party. The matangara correction came directly from the owner, who marked the live photo with a cross and confirmed that the dish shown was mopane worms and pap, while the real matangara photograph was the one an earlier round had removed.

Finding	Why it mattered	What was done
Page titles carried a duplicated brand suffix, for example Rooms and Rates | Big Brother Guesthouse, Usakos | Big Brother, pushing them past the 60 character cut	Google truncates long titles in results, so the brand repeated and information was cut	Removed the automatic template that appended the brand; every page now shows one clean title, verified on all nineteen pages
Thirteen pages had no social share tags at all	Links shared on WhatsApp and Facebook showed no preview image, title or description	Added Open Graph and Twitter card tags to every page, with the guesthouse and restaurant photographs as the share images
The footer trust link pointed at namibiatourism.com.na, which serves an empty hosting placeholder page	A dead link on every page of the site, attached to the registration badge itself	The badge now links to the board's own directory entry for the guesthouse at visitnamibia.com.na, verified live before the switch
The Matangara and pap photo showed mopane worms	A mislabelled dish on a page that sells food, marked by the owner with a cross	Restored the owner's original matangara photograph, and the mopane worms photograph became its own card at its printed menu price of N$100
The guesthouse page claimed rates are not published while the rooms page lists every rate	Contradictory copy weakened trust in both pages	The copy now points at the full rates table and the WhatsApp booking line
Structured data lacked an alternate name and outbound profile links	Search engines had a thinner picture of the business and its other homes on the web	Added the alternate name Big Brother Guest House and sameAs links to the NTB directory and the TripAdvisor listing

Table 2. Findings, impact and fixes, all live on 15 October 2026.

Verification was done in three passes, the same discipline as earlier rounds. First the repair was checked on a local production build, including a full-page render at 390 pixel phone width to confirm nothing shifted. Then the changes were pushed to GitHub, from where the hosting deploys automatically. Finally the live site was re-fetched and every marker confirmed: clean titles, share tags present, the new listings section, the corrected NTB link and both dish photographs serving correctly.

4. Speed: the measured numbers

Speed was measured against the live production site with Chrome on a phone-sized screen on 15 October 2026, after the fixes were deployed. These are laboratory measurements on a clean connection, which is the standard way to compare against Google's published thresholds; real guests on weak rural mobile data will see somewhat higher numbers, but the gap to the thresholds below is large enough that the site stays comfortably inside them.

Measurement	Result	Google threshold	Verdict
First Contentful Paint	492 ms	under 1,800 ms	Excellent
Largest Contentful Paint	908 ms	under 2,500 ms	Excellent
Cumulative Layout Shift	0.00	under 0.10	Perfect
Home page transfer	97 to 106 KB	site budget 500 KB	Well under
Requests per home load	8 to 45	no set target	Lean

Table 3. Live laboratory vitals, mobile screen, 15 October 2026.

Two things stand behind these numbers and both are worth keeping as the site grows. The photographs are served in modern AVIF and WebP formats at exactly the size each screen needs, and the pages are delivered as static files from a content delivery network, so nothing is computed on the fly for a first-time visitor. As long as new photographs keep going through the same pipeline and no heavy scripts are added, the site will stay this fast. The 500 KB per page budget was set in the original build rules and the home page now uses roughly a fifth of it on a first load.

5. Listings, the NTB and the competition

Search rankings for a guesthouse are only half the story: guests also find the property through booking platforms, map listings and directories, and those records must agree with the website. The audit searched the major platforms for the guesthouse under every spelling of the name and verified each hit by opening the page. Where a listing exists it is listed below with its state; where none exists, that is stated too, and no address was invented to fill a gap.

5.1 Where the guesthouse stands today

Platform	What the listing shows	State
Google Maps and Business Profile	Correct name, Plot 7 address, +264 81 264 7606, website bigbrotherguesthouse.com, 42 reviews	Healthy
TripAdvisor	Seven reviews and four photos, several years old, including one negative review never answered	Owner should reply and refresh
SafariNow	A bookable page, but it shows three rooms, a wrong map pin and prices in rand	Owner should update
Namibia Tourism Board directory	Official entry at visitnamibia.com.na, but contacts still show a 2017 landline and old email	Ask the board to update
Telecom online directory	Correct name and current phone number	Fine as is
Agoda, Booking.com, Airbnb, Lekkeslaap	No listing found under any spelling; absence verified on 15 October 2026	Send the link if one exists

Table 4. Verified listing inventory for Big Brother Guesthouse.

5.2 The NTB link back

The owner asked for a link back to the Namibia Tourism Board, and the audit found something better than the link the site had. The old address, namibiatourism.com.na, currently serves an empty hosting placeholder, so the badge was pointing every visitor at a blank page. The board's real public establishment directory lives at visitnamibia.com.na, and the guesthouse has its own entry there. The footer badge now links to that entry, and the registration details, registration number GHO01094, the class, the approval and certificate dates and the section of the Tourism Board Act, remain available in the registration modal that opens from the guesthouse page.

One correction belongs here for honesty: the directory entry itself still shows a 2017 landline and an old email address, and the registration number is not displayed on the public entry. Both are worth one email to the board, because a guest who checks the directory should find the same numbers as on the website. The website deliberately shows the registration number from the owner's own certificate, which is the stronger trust signal either way.

5.3 The new when-we-are-full section

The owner asked for a section about the competition for the case when Big Brother is full, and it is now live on the guesthouse page, with a cross-link from the booking page. It lists nine real, verified alternatives in three groups: the Bahnhof Hotel, Nubeb and Issa Guesthouse in town; Uitkyk Guest Farm, Carlo's Mountain Lodge and Achab Camping within fifteen minutes; and Hohenstein Lodge, Ameib and Spitzkoppe Cabin Camp for those heading towards the mountains. Every entry links to the establishment's own page, and every blurb was written from the research rather than copied.

This kind of section does three jobs at once. It catches guests the guesthouse cannot host, and a helpful answer to a full house is remembered far longer than a dead end. It gives search engines exactly the kind of honest local content they reward for phrases such as Usakos accommodation. And it makes the site a small hub for the town, which is the sort of page other local businesses link back to.

5.4 The two names

The owner confirmed both trading names: Big Brother Guesthouse for the plot on the B2, and Big Brothers for the restaurant in town. The public record agrees. Every directory and platform uses Big Brother Guesthouse in the singular for the guesthouse, and the restaurant appears everywhere as Big Brothers Restaurant, which matches every physical sign. No business named Three Brothers exists in Usakos, so the earlier question about that spelling is closed. The spaced two-word form Big Brother Guest House appears in press articles, so it was added to the site's structured data as an alternate name, which lets search engines connect all the spellings to one business.

6. Your action list

Everything in this list needs the owner's accounts or the owner's knowledge; nothing here can be done from the website side. The items are ordered by value for the effort they take. The first one is by far the most important: Google Search Console is the only place that shows which searches actually bring guests to the site, which pages Google has indexed, and where errors appear, and it costs nothing but a Google account and half an hour.

#	Action	Why it matters	Effort
1	Register Google Search Console for www.bigbrotherguesthouse.com and submit sitemap.xml	Shows the searches that bring guests, the pages Google has found, and any errors; speeds up indexing of the new site	About 30 minutes
2	Delete the old bigbrother-guesthouse.vercel.app project on the targis47 account	Two live copies of the site split Google's attention; the old one still shows a pre-round-6 build	5 minutes in the Vercel dashboard
3	Reply to the unanswered TripAdvisor review and refresh SafariNow with the real room count, photos and map pin	These are the only two bookable third-party listings found; stale data costs bookings and an answered review is public customer care	About 1 hour

#	Action	Why it matters	Effort
4	In the restaurant's Google Business Profile, replace the dead website bigbrother-usakos.com with bigbrotherguesthouse.com/restaurant	Hungry visitors searching the restaurant currently land on a broken page	10 minutes
5	Email the Tourism Board to update the directory entry: new numbers, current email	The board's own record still shows a 2017 landline and an old email address	One email
6	Send the Agoda listing link if one exists	No Agoda listing was found under any spelling of the name; nothing was invented to fill the gap, so the link must come from the owner	One message
7	Rotate the GitHub and Vercel access tokens that appeared in the chat	Both were pasted in plain text and used once; treat them as spent	15 minutes
8	When ready: flip the Gofile folder with the new location photographs to public, send the tenth anniversary photographs, and confirm the restaurant's closing times	The hero slideshow gets the new shots, the anniversary section gets its photos, and the hours line loses its open-ended wording	As available

Table 5. Owner actions in priority order.

With the Search Console account set up and the two stale listings refreshed, the site has everything it needs to compete for the searches that matter to a B2 stopover: Usakos accommodation, guesthouse near Spitzkoppe, and a table in Usakos town. New domains typically take days to a few weeks to settle in search results, and the Search Console graphs will show the curve. The audit findings in this report were all verified live on the production site on 15 October 2026, and the same checklist can be repeated after the next round of changes.
